

Setting Up and Using Your 12-Volt Silva-Cap Generator

*First of all, we THANK YOU for your purchase from ColloidalSilverHowTo.com!
We hope we'll have the opportunity to serve you again in your quest for optimal health.*

Thank you for your purchase!

Below is a list of steps in using your 12-Volt Generator with our own Silva-Cap design. We have found that it is probably the simplest and least expensive colloidal silver producing generator on the market.

We recommend that you unpack the box, lay everything out on a table or countertop, and rinse or wash the following items: If you purchased a kit that included a quart jar, please hand wash this jar with soap and hot water, and rinse thoroughly.

If you purchased silver rods with your generator, we suggest that you clean these rods first, by rinsing them in warm water, drying them, and then lightly cleaning them with the green abrasive pad included with your rods. Then, wipe the rods with a clean paper towel.

Next, find a location to make your colloidal silver. We recommend a place, usually the kitchen, away from direct sunlight.

Then, fill your clean jar with distilled water. It's okay to fill it all the way up to the level of the jar threads where the Silver-Cap screws on.

Take the Silva-Cap, and install your 12-gauge or 14-gauge silver rods from the underneath side of the cap. Install them one at a time through each of the smallest rubber supports in the cap. Push each rod through the rubber support until approximately 1/4" to 3/8" appears.

Install the Silva-Cap onto the jar. Carefully turn the jar while holding the lid until the lid is snugly tightened onto the jar.

Check to make sure that the silver rods are parallel to each other in the distilled water. The rubber supports will hold the silver rods in the ideal position, but check to see if you need to adjust them slightly from outside the cap.

On the 12-volt transformer, unwrap the cord so that you can work and move your jar unencumbered. Then, take the two colored alligator clips and apply them to the ends of the silver rods visible above the surface of the Silva-Cap. It does not matter which colored clip attaches to which rod. Plug the transformer into the a standard household receptacle.

Below are some general comments and Frequently Answered Questions about our process:

How long will it take to produce colloidal silver using the 12-volt generator?

Generally, I make a very nice, clear and stable batch of colloidal silver in approximately 3 to 4 hours. Some people produce for longer periods of time, and some for shorter periods. If you purchased or own a laser pen light, I suggest that you check your colloidal silver every 30 minutes or so during your first production period. Watch for a dense, but translucent beam of light when shining the laser through the jar of water.

I see "black gunk" beginning to form on one of the rods. Should I be concerned?

During the course of production, it is not unusual to begin to see a black coating forming on one of your silver rods. This is simply silver oxide, is harmless, and can be filtered away if it becomes free and floats in the water prior to colloidal silver production. It is a by-product of colloidal silver production, when running a very low current through distilled water. Know that the longer your production is in process, the more silver oxide will form. Again, it is a harmless bi-product of the process.

Should I filter my colloidal silver solution after production?

I always filter my colloidal silver after production. I simply use a clean kitchen funnel (plastic), put in a standard coffee filter, and pour my colloidal silver through the funnel and filter into a clean jar for storage. I use all glass jars when I produce and store my colloidal silver.

How much colloidal silver should I consume?

I use colloidal silver as a nutritional supplement, to enhance the level of health in my body by better enabling my body to care for itself.

Therefore, during the summer months, I hardly take colloidal silver at all because (fortunately) I and my household are generally quite healthy. During the fall, winter and spring months, I generally take 1 to 2 tablespoons of colloidal silver per day, especially when I become aware that there are colds and flu in the air. I then increase dosages and numbers of dosages throughout the day if I feel that I am possibly becoming ill.

Are there any negative side effects to consuming colloidal silver?

Frankly, in the dosages described above, over the years I have consumed colloidal silver, I have encountered no ill effects. The "blue man" syndrome we've all been frightened into believing is a risk can only be experienced, from my reading and personal use, if you produce colloidal silver 100x stronger, and consume upwards of 1 quart to 1 gallon of this super-strong solution per day on long periods of weeks and months. That will be incredibly unlikely. However, there is evidence that if you are enhancing your colloidal silver production by adding saline, you could be creating the potentially harmful compound "silver chloride." It is thought that high levels of silver chloride lead to argyria, or "blue man syndrome." We do not recommend saline or salt to be used in your colloidal silver production.

Are there any other uses for colloidal silver?

I use colloidal silver for many things. When I have sinus issues, and feel a sinus infection may be on its way, I put colloidal silver in a mister bottle (available on our site), and spray each nostril 3 to 6 times every few hours until the symptoms go away. I spray colloidal silver on scrapes, cuts and sunburns to eliminate inflammation and infection. The uses are endless! Please check back with our website to purchase a nice selection of misters, spray bottles, eye-droppers and storage jars for colloidal silver gel.
